---

**Genomics on Beagle2**

**Installed packages**

Packages and programs can be uploaded simply by using the `module` command. To see what versions are available of a program type `module avail packagename`, e.g., `module avail bwa`

(REMEMBER TO ADD breakseq and another one I installed and forgot to document)

**Bamtools**

Information about bamtools can be found, for example, at [https://github.com/pezmaster31/bamtools/wiki](https://github.com/pezmaster31/bamtools/wiki) current versions are

> module avail bamtools

```
--------------------------------------------------------------------------- /soft/modulefiles/applications
---------------------------------------------------------------------------
bamtools/2.1.1(default)
```

Where the default version is indicated.
Loading bamtools

- To use the default version of bamtools:

```
module swap PrgEnv-cr Jurassic PrgEnv-gnu
module load bamtools
```

- To use the specific version of bamtools (<vers>):

```
module swap PrgEnv-cr Jurassic PrgEnv-gnu
module load bamtools/<vers>
```

Please inform us if a specific version you are interested in is not available

Running bamtools

Applications should be run on the compute nodes using the `qsub`. Bamtools can be used to perform a number of analysis and there are parameter settings that have to date show to be effective when used on Beagle2.

Note that bamtools requires shared libraries to work, so scripts need to include

```
export CRAY_ROOTFS=DSL
```

The scripts set up a number of environmental variables that can be used to link and use the various libraries provided by bamtools:

```bash
BAMTOOLS_HOME /soft/bamtools/gnu/2.1.1/usr/local
LD_LIBRARY_PATH /soft/bamtools/gnu/2.1.1/usr/local/lib/bamtools
BAMTOOLS_INCLUDE_OPTS -I/soft/bamtools/gnu/2.1.1/usr/local/include
BAMTOOLS_POST_LINK_OPTS -L/soft/bamtools/gnu/2.1.1/usr/local/lib
```

Other variables will be added when necessary (or requested).

Bedtools

Loading bedtools

- To use the default version:

```
module swap PrgEnv-cr Jurassic PrgEnv-gnu
module load bedtools
```

Breakdancer

Information about breakdancer can be found, for example, at [http://breakdancer.sourceforge.net/](http://breakdancer.sourceforge.net/) current versions are

```
module avail breakdancer
```

Where the default version is indicated.

Loading breakdancer

- To use the default version of breakdancer:

```
module swap PrgEnv-cr Jurassic PrgEnv-gnu
module load breakdancer
```

- To use the specific version of breakdancer:
module swap PrgEnv-cray PrgEnv-gnu
module load breakdancer/<vers>

Running breakdancer

Applications should be run on the compute nodes using the qsub. Breakdancer can be used in cpp version (which will be in your path when you load the module and call breakdancer_max) and in the perl version, which will be available also in the path or can be linked at ${BREAKDANCE_R_HOME}/perl, where one can find:

AlnParser.pm bam2cfg.pl Poisson.pm

BWA - Burrows-Wheeler Alignment Tool

Information about bwa can be found, for example, at http://bio-bwa.sourceforge.net/bwa.shtml current versions are

module avail bwa
------------------------------------------ /soft/modulefiles/applications
------------------------------------------
bwa/0.5.9   bwa/0.6.1(default)

Where the default version is indicated.

Loading bwa

- To use the default version of bwa:

module swap PrgEnv-cray PrgEnv-gnu
module load bwa

- To use the specific version of bwa (in this instance 5.9):

module swap PrgEnv-cray PrgEnv-gnu
module load bwa/0.5.9

Running bwa

Applications should be run on the compute nodes using the qsub. Bwa can be used to perform a number of analysis and there are parameter settings that have to date show to be effective when used on Beagle2.

Bowtie2

Information about bowtie2 can be found, for example, at http://bowtie-bio.sourceforge.net/bowtie2/index.shtml current versions are

module avail bowtie2
------------------------------------------ /soft/modulefiles/applications
------------------------------------------
bowtie2/2.0.0-beta6(default)

Where the default version is indicated.

Loading bowtie2

- To use the default version of bowtie2:

module swap PrgEnv-cray PrgEnv-gnu
module load bowtie2
To use the specific version of bowtie2 (in this instance `<vers>`):

```
module swap PrgEnv-cray PrgEnv-gnu
module load bowtie2/<vers>
```

**Running bowtie2**

Applications should be run on the compute nodes using the `qsub bowtie2`, `bowtie2-align`, `bowtie2-build`, `bowtie2-inspect` can be used directly because loading the module adds them to the path. The scripts related to bowtie2 are found under `${BOWTIE2_HOME}/scripts`, there one can find also the doc directory and the example directory.

**CUFLINKS - Transcript assembly, differential expression, and differential regulation for RNA-Seq**

Information about cufflinks, cuffdiff cuffmerge and so on can be found, for example, at [http://cufflinks.cbcb.umd.edu/index.html](http://cufflinks.cbcb.umd.edu/index.html) current versions are:

```
module avail cufflinks
```

```
--------------------------- /soft/modulefiles/applications ---------------------------
cufflinks/1.3.0 (default)  cufflinks/2.0.0
```

**Loading cufflinks**

- To use the default version of cufflinks:

```
module swap PrgEnv-cray PrgEnv-gnu
module load cufflinks
```

- To use the specific version of cufflinks (in this instance `<vers>`):

```
module swap PrgEnv-cray PrgEnv-gnu
module load cufflinks/<vers>
```

**Running cufflinks**

Applications should be run on the compute nodes using the `qsub`. Cufflinks is part of a software package that includes other analysis tools such as `cuffdiff` and `cuffmerge`, they will all be in the PATH variable when the module is loaded.

**The Genome Analysis Toolkit (GATK)**

Information about GATK can be found, for example, at [http://www.broadinstitute.org/gsa/wiki/index.php/GATK](http://www.broadinstitute.org/gsa/wiki/index.php/GATK)

* Please notice that loading GATK automatically loads java with `module load java`

Current versions are

```
module avail gatk
```

```
-------------------------- /soft/modulefiles/applications ---------------------------
gatk/1.5-32 (default)  gatk/2.2-4
```

Where the default version is indicated.

**Loading GATK**

- To use the default version of GATK:

```
module swap PrgEnv-cray PrgEnv-gnu
module load gatk
```

```
```
module load gatk

- To use the specific version of GATK (in this instance <vers>), we recommend using specific versions in order to avoid surprises when defaults are changed:

  module load gatk/<vers>

Running GATK

Applications should be run on the compute nodes using qsub. GATK can be used to perform a number of analysis via various java jar files. For example to run it inside of a PBS script, you can just use

aprun <aprun-options> java <java-options> -jar ${GATK_DIR}/GenomeAnalysisTK.jar <GATK-options>

Thus, every time you change GATK version you do not need to change the directory you look it into because the

module load GATK/<vers>

will set the variable $GATK_DIR automatically to the new location.

To find more information about how to run the GATK, one can execute commands such as:

  java -jar ${GATK_DIR}/GenomeAnalysisTK.jar --help | less

or look at the Broadinstitute web site at

  http://www.broadinstitute.org/gatk/guide/

Picard

Information about picard can be found, for example, at http://picard.sourceforge.net/index.shtml

* Please notice that loading picard automatically loads java with module load java

Current versions are

module avail picard
-------------------------- /soft/modulefiles/applications --------------------------
picard/1.57          picard/1.60            picard/1.67(default)

Where the default version is indicated.

Loading picard

- To use the default version of picard:

  module load picard

- To use the specific version of picard (in this instance 1.57):

  module load picard/1.57

Running picard

Applications should be run on the compute nodes using qsub. Picard can be used to perform a number of analysis and there are parameter settings that have to date show to be effective when used on Beagle. For example to run SortSam inside of a pbs script, you can just use

aprun <aprun-options> java <java-runtime-options> -jar ${PICARD_DIR}/SortSam.jar <picard-options>

Please note that you should load the java module on the shell script when running on the compute node.

Thus, every time you change picard version you do not need to change the directory you look it into because the

module load picard/<vers>
will set the variable $PICARD_DIR automatically to the new location.

**Pindel**

Information about pindel can be found, for example, at https://trac.nbic.nl/pindel/ current versions are

```bash
> module avail pindel
----------------------------------------------------------- /soft/modulefiles/applications
pindel/0.24s(default)
```

Where the default version is indicated.

**Loading pindel**

- To use the default version of pindel:

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load pindel
  ```

- To use a specific version (<vers>):

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load pindel/<vers>
  ```

Please inform us if a specific version you are interested in is not available

**Running pindel**

Applications should be run on the compute nodes using the `qsub`. `pindel` `pindel2vcf` `sam2pindel` are set on the path once the module is loaded.

**Samtools**

Information about samtools can be found, for example, at http://samtools.sourceforge.net/ current versions are

```bash
> module avail samtools
----------------------------------------------------------- /soft/modulefiles/applications
samtools/0.1.18(default)
```

Where the default version is indicated.

**Loading samtools**

- To use the default version of samtools:

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load samtools
  ```

- To use the specific version of samtools (<vers>):

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load samtools/<vers>
  ```

Please inform us if a specific version you are interested in is not available

**Running samtools**

Applications should be run on the compute nodes using the `qsub`. `samtools` can be used to perform a number of analysis and there are parameter settings that have to date show to be effective when used on Beagle2.
NCBI SRA-SDK

Information about sra-sdk can be found, for example, at http://www.ncbi.nlm.nih.gov/Traces/sra/sra.cgi?view=software current versions are

> module avail ncbi-sra-sdk
----------------------------------------------------------- /soft/modulefiles/applications
------------------------------------------------------------
samtools/2.1.10(default)

Where the default version is indicated.

Loading NCBI sra-sdk

  • To use the default version:

    module swap PrgEnv-cray PrgEnv-gnu
    module load ncbi-sra-sdk

  • To use a specific version (<vers>):

    module swap PrgEnv-cray PrgEnv-gnu
    module load ncbi-sra-sdk/<vers>

Please inform us if a specific version you are interested in is not available

Running NCBI sra-sdk

Applications should be run on the compute nodes using the qsub. The toolkit can be used to perform a number of operations on various kinds of files, such as sam and fastq files. Libraries are also available (see module show ncbi-sra-sdk, to see some of the options)

SGA -- String Graph Assembler

Information about sga can be found, for example, at https://github.com/jts/sga/

* Please notice that loading sga automatically loads

    module load sparsehash
    module load bamtools
    module load hoard

and requires a GNU environment (if you don't load it it will tell you)

Current versions are

> module avail sga
---------------------------- /soft/modulefiles/applications ----------------------------
sga/0.9.19(default)

Where the default version is indicated.

Loading sga

  • To use the default version of sga:

    module load sga

  • To use the specific version of sga (in this instance <vers>):

    module load sga/<vers>

Running sga
Applications should be run on the compute nodes using the `qsub`.

Note that sga requires shared libraries to work, so scripts need to include

```bash
export CRAY_ROOTFS=DSL
```

### Tabix (bgzip)

**Loading Tabix**

- To use the default version:

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load tabix
  ```

### Tophat

Information about tophat can be found, for example, at [http://tophat.cbcb.umd.edu/](http://tophat.cbcb.umd.edu/) current versions are

```bash
> module avail tophat
------------------------------ /soft/modulefiles/applications
------------------------------
tophat/2.0.1(default)
```

Where the default version is indicated.

**Loading tophat**

- To use the default version of tophat:

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load tophat
  ```

- To use the specific version of tophat (in this instance `<vers>`):

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load tophat/<vers>
  ```

### Running tophat

Applications should be run on the compute nodes using the `qsub`. Applications related to tophat can be found by typing `ls $TOPHAT_DIR` and can be used directly because loading the module adds them to the path.

### Vcftools

**Loading vcftools**

- To use the default version:

  ```bash
  module swap PrgEnv-cray PrgEnv-gnu
  module load vcftools
  ```

TO DO

Documentation

- Finish vcftools, bedtools, tabix and their related software, add comments about linking and other env variables
- How to use perl modules included
- How to use libraries (e.g., libbam.a with compilers and so on)
- How to run massive calculations based on the various tools and their support software (python, perl, java...)
- How to run complex calculations using swift adding relevant modules that work when packed
- Describe the reference genomes available and add material.

Installation

- MACS (http://liulab.dfci.harvard.edu/MACS/).
- Also, MACH (http://www.sph.umich.edu/csg/abecasis/MACH/tour/imputation.html)
- As an aside you can use the Broad Institute's GATK https://www.broadinstitute.org/gatk/guide/tooldocs
  /org_broadinstitute_gatk_tools_walkers_genotyper_UnifiedGenotyper.php tool with multi-threading enabled. The differences in the output
  of the two are likely to be subtle and you will have so many SNPs to look at that you won't have time to worry about the odd FP or FN.
  Alternatives are running samtools splitting regions (e.g., chromosomes) or parallelizing samtools. When Beagle is up I will (hopefully)
  make a samtools module and then GATK. We can of course tests them on some files and see how they perform in practice.
- Varscan2
