How to Build Various Common Applications and Libraries on Beagle2

While many applications and libraries are already provided by the Beagle support staff, you may find you need to compile these yourself with local modifications or requirements. Below we provide how we compiled the various applications we provide. This document assumes you are already familiar with how to compile code on Beagle. If you are not, please make sure you understand the Beagle programming environment before moving on.

- BAMTOOLS

- VARIANT TOOLS

BAMTOOLS

Currently only compiles with GNU compiler.

git clone git://github.com/pezmaster31/bamtools.git

module switch PrgEnv-cray PrgEnv-gnu

module load cmake
mkdir build
cd build
XTPE_LINK_TYPE=dynamic
CC="cc -dynamic" CXX="CC -dynamic" BamTools_SOURCE_DIR="/lustre/beagle/bamtools_src" cmake ..
make
Edit makefile to add "-dynamic" to the last step, building the binaries:

```bash
make install DESTDIR=<you_dest_dir>
```

Move following libraries into the path, as the installation doesn't seem to work properly:

```bash
# move files to the library path of bamtools (for some reason they did not get copied)
cp /lustre/beagle2/denovo/src/bamtools/lib/libbamtools-utils.so.2.1.0 <your_dest_dir>/lib

cp /lustre/beagle2/denovo/src/bamtools/lib/libjsoncpp.so.1.0.0 <your_dest_dir>/lib
```

**BLAT**

Currently only compiles with GNU compiler.

Setup your environment:

```bash
module switch PrgEnv-cray PrgEnv-gnu
```

Apply the patch file and compile:

```bash
export BLAT_INSTALL=/soft/blat/gnu/3.4/bin
mkdir -p ${BLAT_INSTALL}
export MACHTYPE=x86_64
make BINDIR=${BLAT_INSTALL} CC=cc CFLAGS=-O3
```

**Charm++**

Charm++ currently only compiles with the PGI and GNU compilers and there is no difference in how you compile with either. Below is an example using the PGI compiler.

**NOTE:** for the time being we do not have PGI compiler, it might become available in the future.

Setup your environment:

```bash
module load rca petsc
```

Configure and compile:
env MPICXX=CC MPICC=cc ./build \
  charm++ \
  mpi-crayxt \
  --no-build-shared \
  --with-production \
  -j4 \
  -O3 \
  -DCMK_OPTIMIZE=1
env MPICXX=CC MPICC=cc ./build \
  AMPI \
  mpi-crayxt \
  --no-build-shared \
  --with-production \
  -j4 \
  -O3 \
  -DCMK_OPTIMIZE=1
env MPICXX=CC MPICC=cc ./build \
  FEM \
  mpi-crayxt \
  --no-build-shared \
  --with-production \
  -j4 \
  -O3 \
  -DCMK_OPTIMIZE=1
cd tests
make
# Verify there are no errors when compiling the tests

CGA tools

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

vers=1.5.0.31
vers=1.7.1
subvers=${vers}.5
wget http://sourceforge.net/projects/cgatools/files/${vers}/cgatools-${subvers}-source.tar.gz/download
tar -xvf cgatools-${subvers}-source.tar.gz
module load cmake
module swap PrgEnv-cray PrgEnv-gnu
module load boost
cd cgatools-${subvers}-source
cd build
# WARNING: check the current version and make sure that the
# version of gcc used is compatible with cgatools and with the libraries
# it is using (e.g., boost)
module swap PrgEnv-gnu/4.1.40 PrgEnv-gnu/3.1.49A
module swap gcc/4.7.2 gcc/gcc/4.6.1
module swap xt-mpt xt-mpich2
module swap xt-mpich2/5.6.1 xt-mpich2/5.3.2

  -DCXX_COMPILER=CC -DCMAKE_C_COMPILER=cc \
  -DCMAKE_INSTALL_PREFIX=/lustre/beagle2/genomicsTools/soft/src/cgatools-${subvers}-source \
  -DCMAKE_BUILD_TYPE=Release \
  -DCMAKE_INSTALL_PREFIX=/soft/cgatools/gnu/${vers} \
  /lustre/beagle2/genomicsTools/soft/src/cgatools-${subvers}-source
make -j8
cmake -j8
cmake install
cd /soft/modulefiles/applications/cgatools
ln -s ../../../templates/cgatools $vers

Cufflinks

http://cufflinks.cbcb.umd.edu/downloads/cufflinks-1.3.0.tar.gz
tar -xvf cufflinks-1.3.0.tar.gz
module load python
module load boost
module load samtools

(Needed to create include file on samtools, create a subdir bam there and copy there all the .h files)
CX3=CC cc=cc PYTHON=`which python` ./configure --prefix=/soft/cufflinks/gnu/1.3.0 --with-boost=$BOOST_ROOT
--with-bam=$SAM_HOME
for x in *.cpp *.h; do sed 's/foreach/for_each/' $x > $x; mv $x $x; done

Replace line 24 of common.h
//include <boost/for_each.hpp>
#include <boost/for_each.hpp>
#include <boost/foreach.hpp>
# After because boost was made with 4.6.1
module swap gcc/4.6.1 gcc/4.5.2
make
make install

Gromacs

Gromacs can be built 4 different ways: single precision no MPI, single precision with MPI, double precision no MPI, double precision with MPI. There is no difference in how you compile Gromacs with the different compilers. Below are examples using the PGI compiler. You can find more details here: http://www.gromacs.org/Documentation/Installation_Instructions#Details_for_building_the_FFTW_prerequisite

Before building Gromacs, you need to setup your environment:

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

module unload dmapp
module load fftw gsl

Single precision, No MPI

./configure \
 CC=cc \
 CXX=CC \
 F77=ftn \
 CFLAGS="$FFTW_INCLUDE_OPTS" "$GSL_INCLUDE_OPTS" \
 --prefix=/soft/gromacs/pgi/4.5.3 \
 --disable-shared \
 --enable-fortran \
 --with-fftw3 \
 --with-gsl \
 --disable-threads \
 --enable-all-static \
 --enable-static \
 --disable-mpi \
 --with-external-blas \
 --with-external-lapack \
 --without-xml
make
make install

Single precision, With MPI
Double precision, No MPI

Gromacs 4.5.5 single precision with MPI: custom installation
Before you start installation make sure to have following in your module list:

Currently Loaded Modulefiles:
1) modules/3.2.6.7
2) nodestat/2.2-1.0502.53712.3.109.gem

--without-xml
make
make install

To run Gromacs 4.5.5 on Beagle2, put this in your PBS script:
#!/bin/bash
#PBS -N <job_name>
#PBS -j oe
#PBS -l walltime=48:00:00
#PBS -l mppwidth=64  # this number can be any multiple of 32, since there is 32 cores/node, and this number must match aprun -n 32 (in this case)

source /opt/modules/default/init/bash

# Load modules
module load fftw/3.3.0.4
module load gromacs/4.5.5-single

# Run gromacs
aprun -n 1 -N 1 /soft/gromacs/gnu/4.5.5-single/bin/grompp -f tip3pBox60_equil.mdp -c tip3pBox60_preequil.gro -n tip3pBox60.ndx -p tip3pBox60.top -o tip3pBox60_equil.tpr
aprun -n 64 /soft/gromacs/gnu/4.5.5-single/bin/mdrun -s tip3pBox60_equil.tpr -o tip3pBox60_equil.trr -x tip3pBox60_equil.xtc -e tip3pBox60_equil.edr -g tip3pBox60_equil.log

To learn more about Gromacs installation please visit this page: http://www.gromacs.org/Documentation/Installation_Instructions_4.5

To learn more how to run Gromacs please visit this page: http://www.gromacs.org/@api/deki/files/213/=gromacs_parallelization_acceleration.pdf

**Hoard lib**

This is an alternate version of java other than the IBM java that is installed by default on Beagle.

http://www.cs.umass.edu/%7Eemery/hoard/hoard-3.8/source/hoard-38.tar.gz

module swap PrgEnv-cray PrgEnv-gnu

replace all g++ with CC in makefile

create lib and move .so there

create include and move .h there.

**Sun java**

This is an alternate version of java other than the IBM java that is installed by default on Beagle.

Setup your environment:

module load sun-java

**Swift**

The Swift parallel scripting framework.

Setup your environment:

module load swift

**GSL (GNU Scientific Library)**

There is one slight difference in how you compile GSL with the PGI and Cray from GNU compilers. With the PGI and Cray compilers, you need to do the following immediately after running `configure`: 
sed 's;#define HAVE_INLINE 1;#undef HAVE_INLINE;g' -i config.h

With GNU this is not required.

Below is an example using the PGI compiler.

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

export GSL_VERSION=1.14
./configure \
CC=cc \
--prefix=/soft/gsl/pgi/${GSL_VERSION} \
--disable-shared
sed 's;#define HAVE_INLINE 1;#undef HAVE_INLINE;g' -i config.h
make
make install

LAGAN

LAGAN compiles with bot PGI and GNU compilers.

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

GNU Compiler

Setup your environment:

module switch PrgEnv-cray PrgEnv-gnu

Unzip the source and move the resulting directory to the installation destination:

mkdir -p /soft/lagan/gnu
cd /soft/lagan/gnu
tar zxvf lagan20.tar.gz
mv lagan20 2.0

Apply the src/Makefile patch and src/local/Makefile patch and compile:

rm -f prolagan
make

PGI Compiler

Setup your environment:

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

module switch PrgEnv-cray PrgEnv-gnu

Unzip the source and move the resulting directory to the installation destination:

mkdir -p /soft/lagan/pgi
cd /soft/lagan/pgi
tar zxvf lagan20.tar.gz
mv lagan20 2.0
Apply the src/Makfile patch and src/glocal/Makfile patch and compile:

rm -f prolagan
make

LAMMPS

LAMMPS, currently, only compiles with the GNU compiler.

GNU Compiler

Setup you environment:

module switch PrgEnv-cray PrgEnv-gnu
module load fftw/2.1.5.2

- Install atc Makefile in lib/atc
- Install meam Makefile in lib/meam
- Install poems Makefile in lib/poems
- Install reax Makefile in lib/reax
- Install Beagle Makefile in src/MAKE

Compile LAMMPS:

cd src
make yes-all
make no-gpu
cd ../lib/atc
make -f Makefile-atc.beagle
cd ../meam
make -f Makefile-meam.beagle
cd ../poems
make -f Makefile-poems.beagle
cd ../reax
make -f Makefile-reax.beagle
cd ../src/
sed -i -e 's/fftw.h/dfftw.h/g' fft3d.h
make beagle

METIS

Download either the PGI Makefile or GNU Makefile. The following example assumes PGI:

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

rm -f Makefile.in; ln -sf Makefile-pgi.in Makefile.in
make
mkdir -p /soft/metis/pgi/4.0.1/bin
mkdir -p /soft/metis/pgi/4.0.1/lib
cp graphchk mesh2dual oemetis partdmesh pmetis kmetis mesh2nodal onmetis partnmesh /soft/metis/pgi/4.0.1/bin/
cp libmetis.a /soft/metis/pgi/4.0.1/lib/
NAMD

GNU Compiler

Setup you environment:

module switch PrgEnv-cray PrgEnv-gnu
module load rca petsc charm++ tcl fftw/2.1.5.2

Edit Make.charm and make sure CHARMBASE points to the install of Charm++:

CHARMBASE = $(CHARM_DIR)

Edit arch/CRAY-XT.fft so it looks like:

FFTDIR=$(FFTW_DIR)
FFTINCL=$(FFTW_INCLUDE_OPTS)
FFTLIB=$(FFTW_POST_LINK_OPTS) -lfftw -ldfftw
FFTFLAGS--DNAMD_FFTW
FFT=$(FFTINCL) $(FFTFLAGS)

Edit arch/CRAY-XT.tcl so it looks like:

TCLDIR=$(TCL_DIR)
TCLINCL=$(TCL_INCLUDE_OPTS)
TCLLIB=$(TCL_POST_LINK_OPTS) -ldl
TCLFLAGS--DNAMD_TCL
TCL=$(TCLINCL) $(TCLFLAGS)

Edit arch/CRAY-XT-g++.arch so it looks like:

NAMD_ARCH = CRAY-XT
CHARMARCH = mpi-crayxt

The GNU compilers produce significantly faster NAMD binaries than PGI.
You must run the following to switch CC/cc to the GNU compiler
environment before building either Charm++ or NAMD:

module swap PrgEnv-cray PrgEnv-gnu

Users of psfgen might also need to do 'module remove acml' in order for
the the psfgen compilation to succeed.

CXX = CC -DNO_SOCKET -DDUMMY_VMDSOCK -DNOHOSTNAME -DNO_GETPWUID -DNAMD_NO_STDOUT_FLUSH -DNAMD_NO_O_EXCL
CXXOPTS = -O3 -ffast-math -fexpensive-optimizations -fomit-frame-pointer
CC = cc
COPTS = -O3 -ffast-math -fexpensive-optimizations -fomit-frame-pointer

Compile NAMD:

./config CRAY-XT-g++.arch
cd CRAY-XT-g++
make -j4
**PGI Compiler**

Setup you environment:

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

module load rca petsc charm++ tcl fftw/2.1.5.2

Edit Make.charm and make sure CHARMBASE points to the install of Charm++:

CHARMBASE = $(CHARM_DIR)

Edit arch/CRAY-XT.fftw so it looks like:

```
FFTDIR=$(FFTW_DIR)
FFTINCL=$(FFTW_INCLUDE_OPTS)
FFTLIB=$(FFTW_POST_LINK_OPTS) -ldfftw -ldfftw
FFTFLAGS=-DNAMD_FFTW
FFT=$(FFTINCL) $(FFTFLAGS)
```

Edit arch/CRAY-XT.tcl so it looks like:

```
TCLDIR=$(TCL_DIR)
TCLINCL=$(TCL_INCLUDE_OPTS)
TCLLIB=$(TCL_POST_LINK_OPTS) -ldl
TCLFLAGS=-DNAMD_TCL
TCL=$(TCLINCL) $(TCLFLAGS)
```

Edit arch/CRAY-XT-pgcc.arch so it looks like:

```
NAMD_ARCH = CRAY-XT
CHARMARCH = mpi-crayxt
#
# The GNU compilers produce significantly faster NAMD binaries than PGI.
#
CXX = CC
CXXOPTS = -O
CXXNOALIASOPTS = -fast -Mnodepchk -Msafeptr=arg,global,local,static -Minfo=all -Mneginfo=loop
CC = cc
COPTS = -fast
```

Compile NAMD:

```
./config CRAY-XT-pgcc.arch
cd CRAY-XT-pgcc
make -j4
```

**NCBI Blast+**

We currently only have instructions for compiling Blast+ with the GNU compiler

**GNU Compiler**

Setup you environment:

module switch PrgEnv-cray PrgEnv-gnu
Configure and compile Blast+:

./configure \
CC=cc \
CXX=CC \
--prefix=/soft/ncbi-blast+/gnu/2.2.24 \
--without-dll \
--with-static \
--with-static-exe \
--with-lfs \
--with-mt \
--with-64 \
--without-debug
make
make install

Netlib CBLAS

You can only compile CBLAS using the PGI or GNU compilers. There is no difference in how you compile Netlib CBLAS, only which Makefile you link Makefile.in to. We provide the PGI Makefile and the GNU Makefile. The examples below use the PGI compiler.

NOTE: for the time being we do not have PGI compiler, it might become available in the future.

Setup you environment:

module load acml

Compile and install CBLAS:

rm -f Makefile.in
ln -sf cblas-Makefile.pgi Makefile.in
make all
mkdir -p /soft/cblas/pgi/3.0/lib
cp lib/libcblas.a /soft/cblas/pgi/3.0/lib

PCRE

GNU compiler

We compile PCRE for both shared library support (for SWIG) and for static library support (for Octave). Because compiles default to static libraries, we compile that last.

Setup your environment:

module switch PrgEnv-cray PrgEnv-gnu
export XTPE_LINK_TYPE=dynamic </verbatim>

Configure, build and install the shared library version:

export XTPE_LINK_TYPE=native
./configure \
CC="cc -dynamic" \
CXX="CC -dynamic" \
--prefix=/soft/pcre-gnu/8.12 \
--enable-shared \
--disable-static
make
make install

Configure, build and install the static library version:
Python

It only makes sense to compile Python dynamically since in almost all cases you will want to load Python modules dynamically. Because of this, you have to use Python in DSL mode. We also only compile Python with the GNU compiler.

Setup you environment:

```
module switch PrgEnv-cray PrgEnv-gnu
module unload xt-mpt pmi
```

Configure and compile:

```
./configure \
  CC=cc \n  CXX=CC \n  --prefix=/soft/python/2.7.1 \n  --enable-shared \nmake
make install
```

Biopython

Setup your environment:

```
module load python
export XTPE_LINK_TYPE=dynamic
export BIOPYTHON_ROOT=/soft/python/modules/biopython/1.56
```

Build Biopython:

```
mkdir -p ${BIOPYTHON_ROOT}/lib/python2.7/site-packages
env LDFLAGS="-L/soft/python/2.7.1/lib" python setup.py build
PYTHONPATH=${PYTHONPATH}:${BIOPYTHON_ROOT}/lib/python2.7/site-packages python setup.py install --prefix ${BIOPYTHON_ROOT}
```

NumPy

```
module swap PrgEnv-cray PrgEnv-gnu
```

```
module load python/2.7.3-vanilla
module load acml
module load metis
module load SuiteSparse
module load swig
export XTPE_LINK_TYPE=dynamic
export NUMPY_ROOT=/soft/python/2.7/2.7.3-vanilla/modules/numpy/1.7.0
export BLAS=""
export LAPACK=""
export ATLAS=""
export LDFLAGS="-L/soft/python/2.7/2.7.3-vanilla/python/lib/*"
python setup.py build --compiler=unix --fcompiler=gnu95
PYTHONPATH=${PYTHONPATH}:${NUMPY_ROOT}/lib/python2.7/site-packages python setup.py install --prefix ${NUMPY_ROOT}

**PIL**

Setup your environment:

module load python
export XTPE_LINK_TYPE=dynamic
export IMAGING_ROOT=/soft/python/modules/imaging/1.1.7
Apply the patch file and compile:

```
mkdir -p ${IMAGING_ROOT}/lib/python2.7/site-packages
env LDFLAGS="-L/soft/python/2.7/2.7.1/lib*" python setup.py build
PYTHONPATH=${PYTHONPATH}:${IMAGING_ROOT} python setup.py install --prefix ${IMAGING_ROOT}
```

**SciPy**

module load pil
export XTPE_LINK_TYPE=dynamic
export SCIPY_ROOT=/soft/python/2.7/2.7.3-vanilla/modules/scipy/0.12.0
mkdir -p ${SCIPY_ROOT}/lib/python2.7/site-packages
export BLAS="/opt/cray/libsci/12.0.00/GNU/47/mc12/lib/libsci_gnu.a"
export LAPACK="/opt/cray/libsci/12.0.00/GNU/47/mc12/lib/libsci_gnu.a"
export ATLAS="/opt/cray/libsci/12.0.00/GNU/47/mc12/lib/libsci_gnu.a"
python setup.py build --compiler=unix --fcompiler=gnu95
repeat at eternum adding -shared to build shared libraries when the idiotic linker is called incorrectly. NEED TO FIND A WAY TO TELL TO THE INSTALLER HOW TO USE GCC TO LINK THE FORTRAN LIBRARIES.

```
export PYTHONPATH=${PYTHONPATH}:${SCIPY_ROOT}/lib/python2.7/site-packages
python setup.py install --prefix ${SCIPY_ROOT}
```

**R**

It only makes sense to compile R dynamically since in almost all cases you will want to load R modules dynamically. Because of this, you have to use R in DSL or CCM mode.

**GNU Compiler**

This has been successfully tested with R up to version 2.13.1 (not all intermediate releases have been tested)

Setup you environment:

If using PrgEnv-gnu/3.1.49A or earlier:
This might be necessary because some of the later versions have issues with shared libraries. Otherwise is sufficient because cray-mpich is the current default (unless you changed it)

Configure and compile:

```bash
./configure \
    CC="cc -dynamic" \
    CXX="CC -dynamic" \
    FC="ftn -dynamic" \
    F77="ftn -dynamic" \
    XTPE_LINK_TYPE=dynamic \
    CPICFLAGS="-fPIC" \
    CPXICFLAGS="-fPIC" \
    FCPICFLAGS="-fPIC" \
    FCPICFLAGS="-fPIC" \
    SHLIB_LDFLAGS="-dynamic" \
    SHLIB_CXXLDFLAGS="-dynamic" \
    --prefix=/soft/R/gnu/2.12.1 \
    --enable-R-shlib \
    --enable-R-static-lib \
    --enable-BLAS-shlib \
    --enable-shared \
    --with-blas=-lsci -lsci_mc12" \
    --with-lapack=-lsci -lsci_mc12" \
    --without-x
make
make install
```

Note that `--prefix=/soft/R/gnu/2.12.1` should point to a local directory (probably under `/lustre/beagle/whoami/soft/R`) if you are building it for yourself.

### SuiteSparse

SuiteSparse currently only builds with GNU compilers. Download the `UFconfig.mk` configuration file and install it as `UFconfig/UFconfig.mk`.

Setup your environment:

```bash
module switch PrgEnv-cray PrgEnv-gnu
module load metis

Copy the configured and built source tree of METIS to the source root of SuiteSparse as `metis-4.0` so that your SpareSuite root looks like:

```
[leggett@sandbox:/soft/build/SuiteSparse]$ ls
AMD/        CSparse_to_CXSparse*      MATLAB_Tools/       SuiteSparse_install.m
BTF/        CSparse/                  MATLAB_Tools/       SuiteSparse_test.m
CAMD/       CSparse_newfiles/         METIS/            SuiteSparse_install.m
CCOLAMD/    CSparse_newfiles.tar.gz   METIS/            SuiteSparse_test.m
CHOLMOD/    KLU/                      METIS/            SuiteSparse_install.m
COLAMD/     LDL/                      METIS/            SuiteSparse_test.m
Contents.m   LINFACTOR/                SuiteSparse/        SuiteSparse_install.m
CSparse/     Makefile                  SuiteSparse/        SuiteSparse_test.m

Build and install SuiteSparse:
```

```
make
make install
```
SGA -- String Graph Assembler

**GNU Compiler**

git clone git://github.com/jts/sga.git

module load sparsehash
module load bamtools
module load hoard

./autogen.sh

CXX=CC cc=cc ./configure --with-sparsehash=${SPARSEHASH_DIR} --with-bamtools=${BAMTOOLS_HOME} --with-hoard=${HOARD_DIR}

make install DESTDIR=<your_dest_dir>

**SKAT**

module load R/2.15.1-vanilla

vers=0.82

wget http://cran.r-project.org/src/contrib/SKAT_${vers}.tar.gz

gunzip SKAT_${vers}.tar.gz

# We try with CC, which is the wrapper for MPI and general system builds
# it is possible that for the package to work properly under Vanilla we
# will need to use CC=g++ cc=gcc

R CMD INSTALL --configure-args="--prefix=$R_HOME --build=X86_64  CC=CC cc=cc" SKAT_${vers}.tar

**SWIG**

**GNU Compiler**

Because SWIG is used with languages such as Python that are dynamically linked, we build SWIG dynamically.

Setup your environment:

module switch PrgEnv-cray PrgEnv-gnu

module load pcre

module load python

export XTPE_LINK_TYPE=dynamic

Configure, build and install SWIG:

```
./configure \  
CC="cc -dynamic" \  
CXX="CC -dynamic" \  
--prefix=soft/swig/gnu/2.0.2
make
make install
```

**Valgrind**

**GNU Compiler**

Valgrind is an instrumentation framework for building dynamic analysis tools. The version that ships from Cray will not work on the compute nodes since it requires /tmp to be writable. We will build a patched version that will honor a user's $TMPDIR environment variable.
Setup your environment:

module switch PrgEnv-cray PrgEnv-gnu

Apply the patch to the Valgrind 3.6.1 source tree:

tar jcvf valgrind-3.6.1.tar.bz2
cd valgrind-3.6.1
cp /path/to/patch/file/tmpdir.patch .
patch -p1 < tmpdir.patch

Configure, build and install Valgrind, allowing it to find the default gcc:

./configure \
   --prefix=/soft/valgrind/gnu/3.6.1
make
make install

To use Valgrind on the compute nodes you will need to set $TMPDIR to something other than /tmp.

VARIANT TOOLS

wget http://sourceforge.net/projects/varianttools/files/1.0.4/variant_tools-1.0.4a.tar.gz/download
tar -xvf variant_tools-1.0.4a.tar.gz

module load python/2.7.3-vanilla

python setup.py install --install-platlib=/soft/variant_tools/gnu/1.0.4/python_lib --install-scripts=/soft/variant_tools/gnu/1.0.4/bin
