Weight-based dosing criteria

The following protocols have weight-based dosing criteria that supplant standard institutional guidelines (i.e., "10% rule")

1. 11-0197 (Final Protocol, 24 February 2011)
   a. BSA calculation is performed predose on day 1 of all cycles

2. 11-0400  (v4.0 06JAN2012)
   a. A patient’s body weight at the start of a cycle is to be used to calculate the dose used throughout the cycle. The first dose of MM-121 administered is 40 mg/kg. Following this loading dose, the subsequent weekly dose of MM-121 is 20 mg/kg. Should a patient’s body weight change by 10% as compared to day 1 of the current cycle, a new total dose should be calculated to reflect this change.
