Identity Management Wiki

Welcome to the Identity Management (IDM) Wiki Page

This wiki provides an interactive way to create a body of knowledge that will serve to guide formal policies and procedures and store information on current projects.

What is a wiki anyway?

A Wiki or wiki (pronounced "wicky" or "weekee") is a website (or other hypertext document collection) that allows a user to add content, as on an Internet forum, but also allows that content to be edited by any other user.

Why does IDM have a wiki?

As an extension of the University of Chicago’s beta test of the Confluence wiki software, IDM has created some basic pages to facilitate communication, consolidate document storage and access and improve workflow and collaborations.

Is it secure?

The wiki sites have a password protected security similar to the University-wide system. Access to different pages may vary and can be regulated by the administrator.

Who can use it?

The wiki pages are designed with a relatively "open" format so multiple people within the community can contribute. The integrity of the information will be determined in large part by the community of users. Although viewing of many pages will not be restricted, for the most part all editing privileges will be limited to members of IDM.

How do I use it?

Using the wiki is a relatively simple and straightforward process. To change the information on a page simply click the "Edit" button located near the top right of the screen. The bar above the text allows you to change the text formatting, create tables, and insert things such as images or links. To change the location of the page in the wiki’s "tree" structure simply click "edit" next to "location", select "Browse" from the menu that appears, and choose the preferred location. To create a page, click “Add - Page” in the top right of the of screen. To browse the wiki, choose a page from the navigation that appears to the left, or alternatively perform a search in the top right portion of the screen.
